# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

### EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

# MORBIDITY FROM DISEASE ONLY COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

## COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATESAll Causes: Disease and Injury:

Morbidity from all causes increased slightly (by 4 percent) during the week ending 18 May, being reported at 597 per year per thousand strength. The current week's admission rate is only 2 percent lower than that for the corresponding week of 1944; this is the smallest differential in morbidity between 1944 and 1945 to date. Morbidity from disease increased correspondingly being reported at 549 per thousand.

The admission rate from injury increased slightly to 48 per thousand. It should be borne in mind that the injury rates reported since October 1944 are not strictly comparable with those prior to that time because of the directive (issued 29 September 1944) which provided for the reporting of injuries existing prior to entry into active service and of readmissions for injury under "disease" rather than under "injury," as was formerly done.

Respiratory Causes:

Morbidity from colds, influenza, etc. was reported at 130 per thousand, or about 5 percent higher than the previous week. The current week's rate is 10 percent higher than that for the corresponding week of 1944, which is the first time this year that the 1945 rate has exceeded the 1944 one.

The admission rate for pneumonia increased to 12 per thousand which is about the same as the rate reported for the corresponding week of 1944.

Common Communicable Diseases:

Morbidity from venereal disease, excluding cases contracted prior to entry on active service increased sharply to 46 per thousand. This reflects in part the normal cyclical trend during the month since the

lowest rate usually occurs during the first week, followed by a steady rise thereafter until the end of the month. The current week's rate is higher than the highest rate reported during any week of 1944.

The admission rate from diarrhea and dysentery remained at 6 per thousand, continuing the low seasonal level anticipated for this time of the year.

The number of new cases of measles increased for the second week to 157. The number of new cases of mumps rose sharply, being reported at 440. The number of new cases of infectious hepatitis increased by over 50 percent to 145.

VARIATION IN MORBIDITY BY SERVICE COMMANDAll Causes: Disease and Injury:

The admission rate for disease increased in most Service Commands; decreases were reported only by the Fifth, Eighth, and Military District of Washington. Correspondingly, the Commands reporting increases showed only slight changes, with the greatest being registered by the First, Third, and Sixth Service Commands (about 15 percent).

The Second Service Command again reported the highest morbidity from all causes (656 per thousand) and from disease (617 per thousand), followed closely by the First and Sixth Service Commands. The lowest admission rate from all causes (540 per thousand) and from disease (498 per thousand) were reported by the Military District of Washington, followed by the Fifth and Seventh Service Commands.

The Fourth Service Command reported the highest morbidity from injury (58 per thousand). All Service Commands except the Fourth, Eighth, and Ninth and the MDW reported rates of less than 40 per thousand.

CONTINENTAL UNITED STATES

## COMMENT ON CURRENT TRENDS (CONT'D)

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased only in the Second, Fifth, and Eighth Service Commands and the Military District of Washington while moderate increases were reported in the others. Increases of 25 percent or more were registered in the Third, Sixth and Ninth Service Commands. The highest morbidity from these causes was reported by the Sixth Service Command (173 per thousand), while the lowest was registered by the Fourth Service Command (107 per thousand).

The admission rate from pneumonia increased notably in the Fourth and Sixth Service Commands. The Eighth Service Command reported the highest morbidity from this cause (20 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases increased in all Service Commands except the Sixth and the MDW. The sharpest increases (20 percent or more) were reported by the First and Fifth Service Commands. The highest morbidity from these causes was reported by the Third Service Command (64 per thousand), followed by the First and Fifth (57 per thousand).

Exceptionally low morbidity from diarrhea and dysentery was reported in every Service Command, except the First which had a rate of 12 per thousand. The number of new cases of measles increased sharply in the Eighth Service Command (principally at Camp Maxey). The number of new cases of mumps rose in most Service Commands. The number of new cases of infectious hepatitis increased notably in the Second Service Command (Camp Kilmer), and moderately in the Eight and Ninth Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate for personnel stationed in the continental United States based on revised data is estimated at 32.8 per thousand strength for the week ending 18 May as compared with approximately 32 per thousand for the corresponding week of 1944. The mean number of non-effectives in this country, including evacuees from overseas, rose to 96.8 per thousand.

PATIENTS REMAINING UNDER TREATMENT: 18 MAY 1945:

The number of neuropsychiatric cases remaining was 37,525 or about 100 more than at the end of the previous week. Non-battle injury patients remaining numbered 48,000. The number of battle casualty patients remaining increased by about 3,400 to number 90,536.

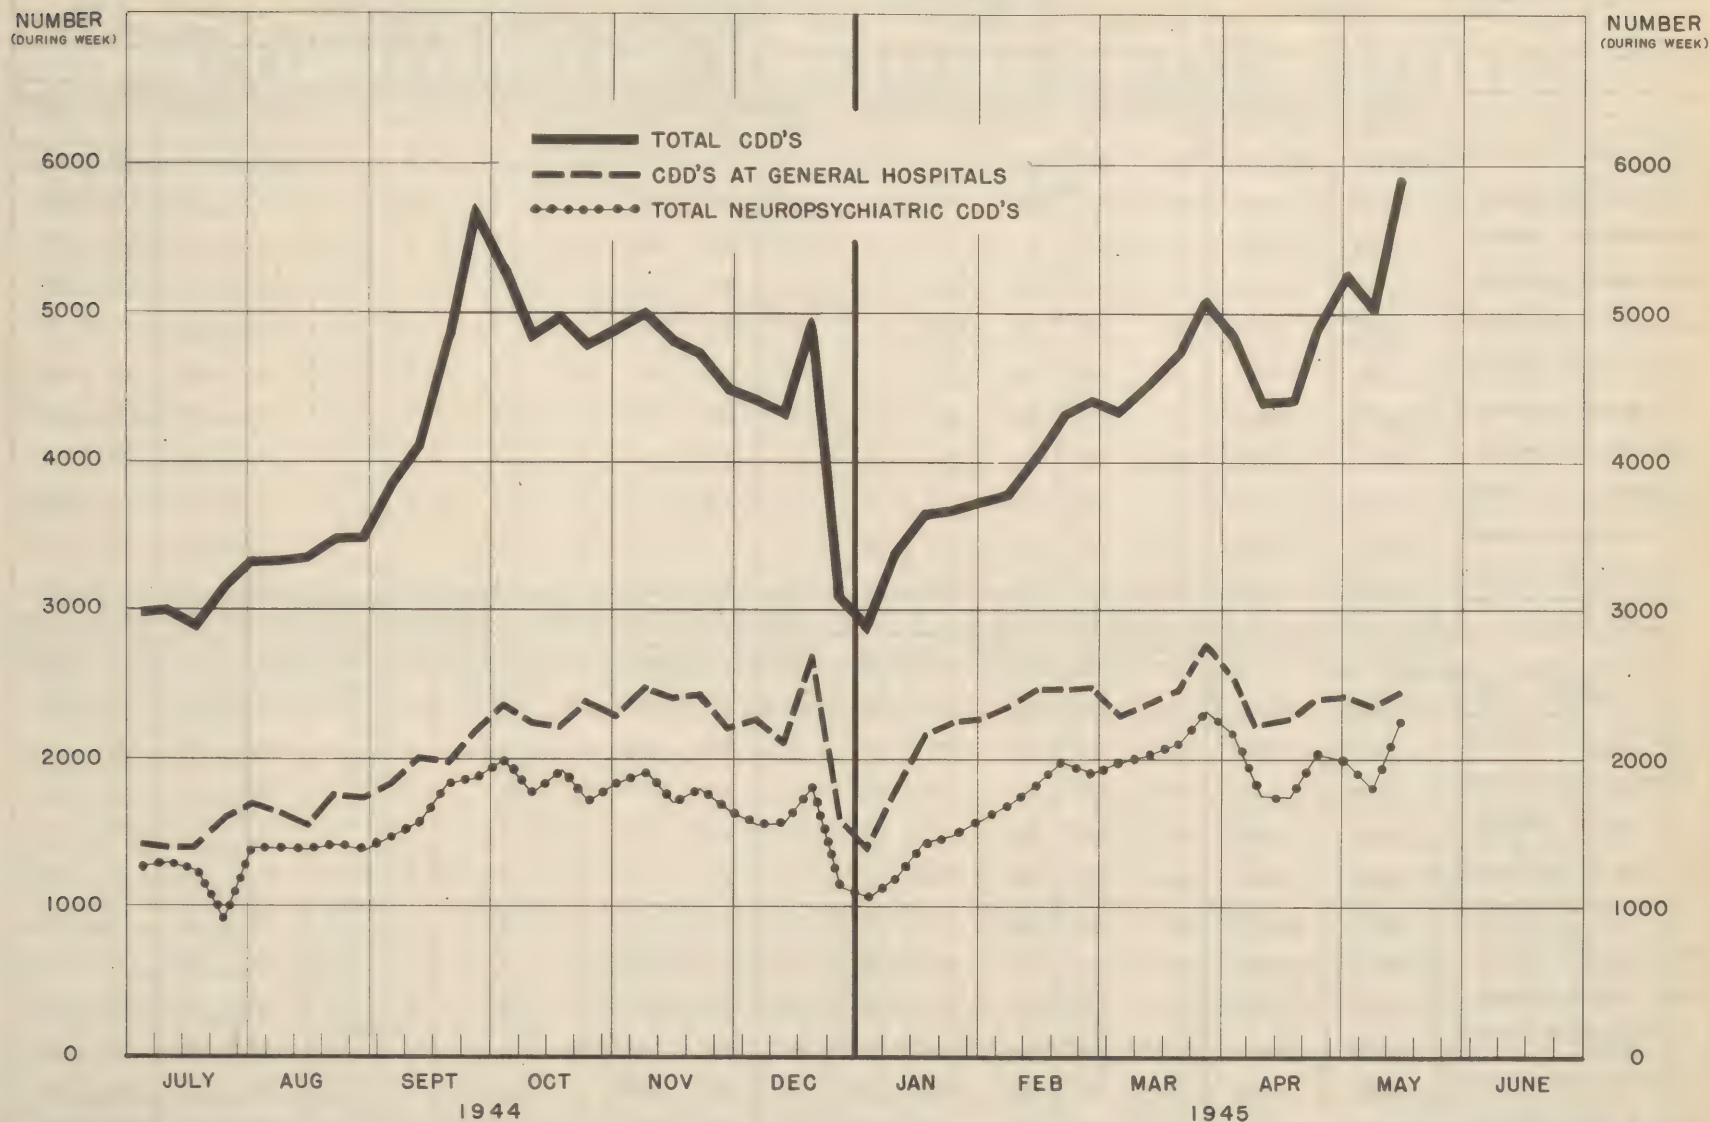

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 18 May there were 5,910 enlisted men discharged by CDD or about 900 more than the previous week. About 41 percent of these discharges were reported by General Hospitals. Included among the 5,910 CDD's were 2,236 neuropsychiatric cases.

## COMMENT ON RECENT DEVELOPMENTS

FOR THE FOUR WEEK PERIOD ENDING 27 APRIL 1945

NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 27 April 1945 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 25. Similar charts for specified diseases appear on pages 27, 29, and 31. A chart showing mortality trends is presented on page 33. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 34. The most pertinent morbidity data for individual stations are presented on pages 35 to 56. On pages 57 and 58 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY:

The admission rates from all causes and from disease for the Army in the continental United States decreased by about 8 percent in April. The Navy shore stations in this country also reported notably lower morbidity in April. The Army's admission rate from disease during April (543 per thousand) was about 6 percent lower than for April 1944. All of the higher morbidity during April 1944 as compared with April 1945 arose from respiratory causes.

The admission rate from injury decreased slightly in April to 48 per thousand which is by far the lowest rate on record. However, the recent experience is not strictly comparable with that prior to October 1944 because the relatively low level of injuries since that time reflects in part at least compliance with the directive issued 29 September 1944 which required re-admitted and EPTS injuries to be reported as "disease" and not as "injury".

Lower morbidity from disease during April as compared with March was reported by every Service Command. Decreases in morbidity of 10 percent or more were

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

reported by the Military District of Washington and the First, Third, Fifth, Seventh, and Eighth Service Commands.

The Second Service Command reported the highest morbidity rates from all causes and from disease in April (both being only about 10 percent higher than for the country as a whole), closely followed by the Ninth Service Command. The lowest admission rates from all causes and from disease were registered in the Military District of Washington (about 15 percent lower than for the country as a whole), followed by the First, Third, Fifth, and Seventh Service Commands. It may thus be noted that there was relatively very little spread between the morbidity rates of the Service Commands having the lowest and highest rates, although in previous winters the range of variation was usually much wider.

The admission rate from injury decreased in all Service Commands except the Sixth where a slight rise was reported. The highest morbidity from injury during April was reported by the Fourth and Eighth Service Commands (56 per thousand), while most of the other Service Commands reported rates of less than 40 per thousand.

RESPIRATORY DISEASES:

During April the admission rate from colds, influenza, etc. decreased by about 25 percent to 122 per thousand, or about the same as the rate for December 1944 and about 25 percent below the corresponding rate for April 1944. Morbidity from respiratory diseases at shore stations of the Navy in this country decreased by about 20 percent during April, although the level of morbidity experienced in the Navy was somewhat higher than for the Army.

Morbidity from colds, influenza, etc. decreased in all Service Commands. Decreases of 40 percent or more were registered in the Third and Fifth Service Commands and the Military District of Washington. The Sixth and Eighth Service Commands reported the highest morbidity from these causes (140 per thousand). The lowest rates were reported in the First and Fourth Service Commands and Military District of Washington (about 100 per thousand).

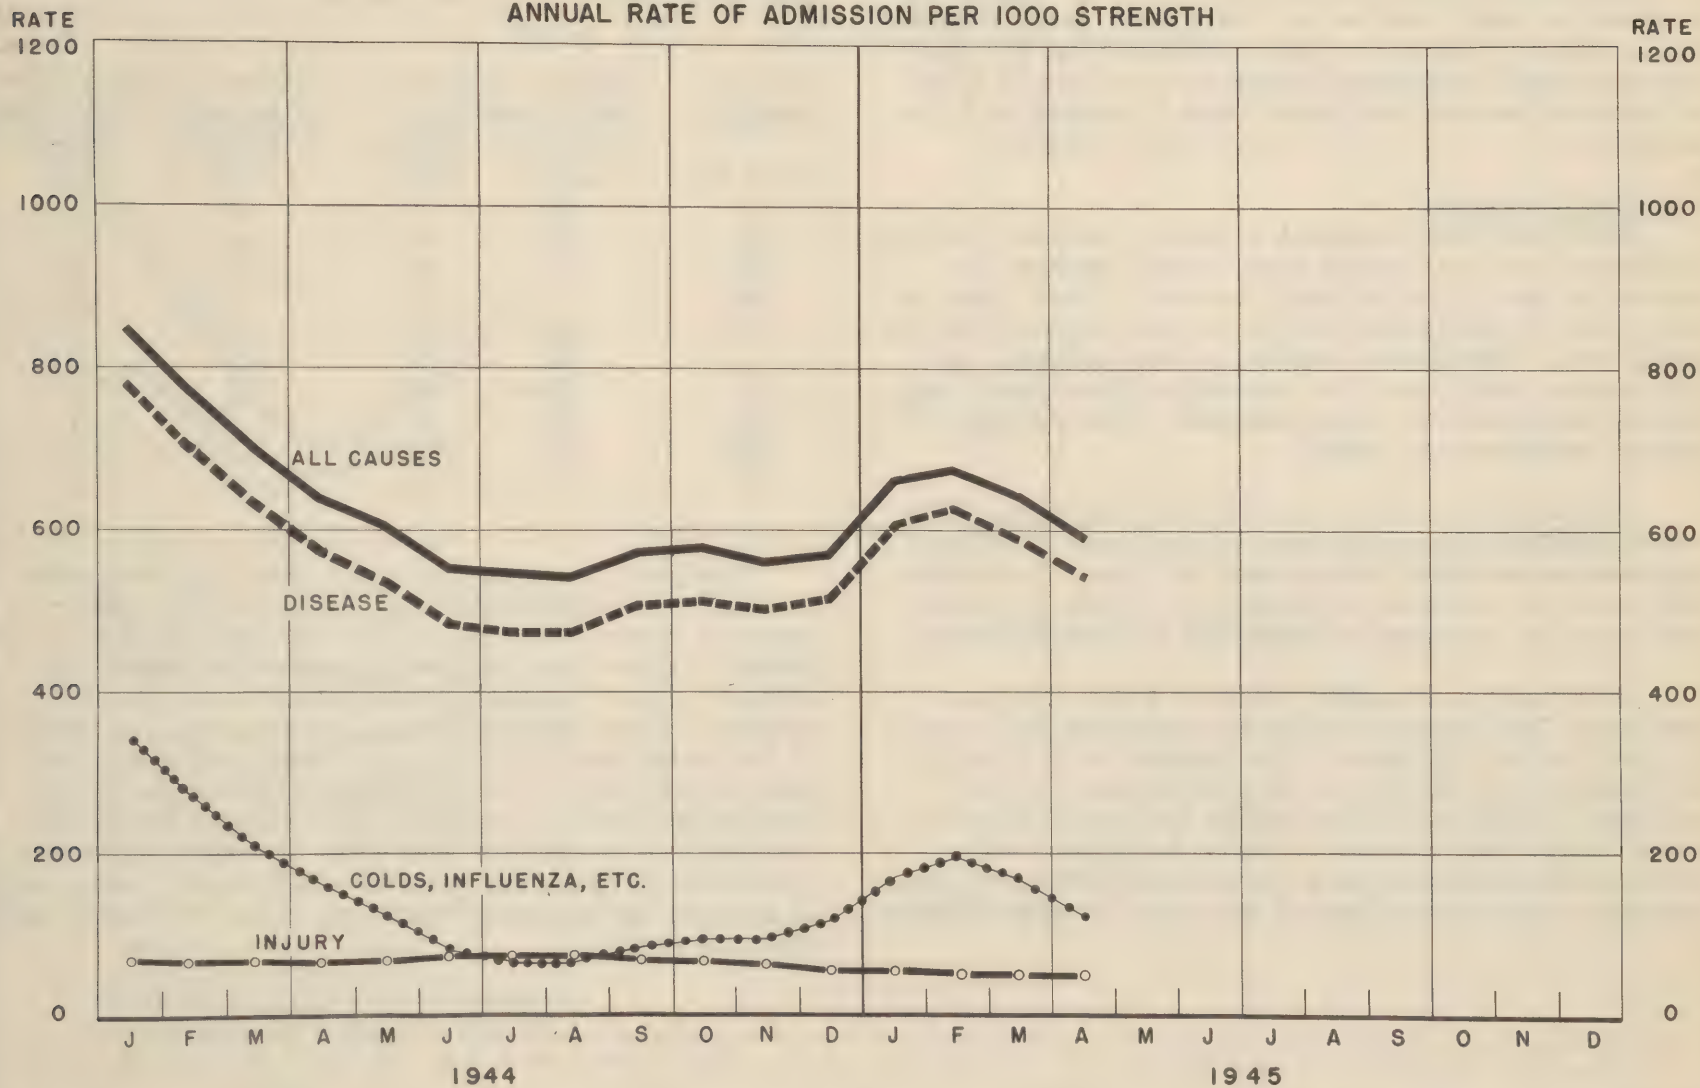

Morbidity from all forms of pneumonia combined decreased by about 20 percent in April. The admission rate for April 1945 was about 20 percent lower than for April 1944. All of the Service Commands reported moderate decreases in April. The Eighth Service Command experienced the highest admission rate from this cause (16 per thousand), closely followed by the Fifth and Sixth Service Commands.

In April, atypical pneumonia accounted for over 70 percent of all pneumonia admissions. The proportion of pneumonia cases diagnosed as atypical was highest in the Fourth and Eighth Service Commands and the Military District of Washington, in all of which it exceeded 75 percent.

# MORBIDITY FROM — ALL CAUSES — DISEASE

## — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES  
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased slightly in April and was at the lowest level reported so far during this war. The admission rate for April 1945 was about 10 percent lower than for April 1944. No Service Command reported a rate in excess of 8 per thousand.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased slightly during April and was higher than for any month of 1944 and about 50 percent higher than for April 1944. The Navy's morbidity from venereal disease during April was at a somewhat higher level than during March, and at about the same level as the Army's experience in April.

The admission rate for syphilis, excluding EPTS cases remained about the same in April and was about the same as reported during most of 1944. The admission rate for venereal diseases other than gonorrhea and syphilis increased slightly to 1.1 per thousand.

Most Service Commands reported about the same morbidity from venereal diseases excluding EPTS cases in April as during March. The highest rate in April was reported by the Third Service Command (62 per thousand), followed by the Second and Sixth Service Commands (51 per thousand). Only the Eighth and Ninth Service Commands and the Military District of Washington recorded rates of less than 40 per thousand.

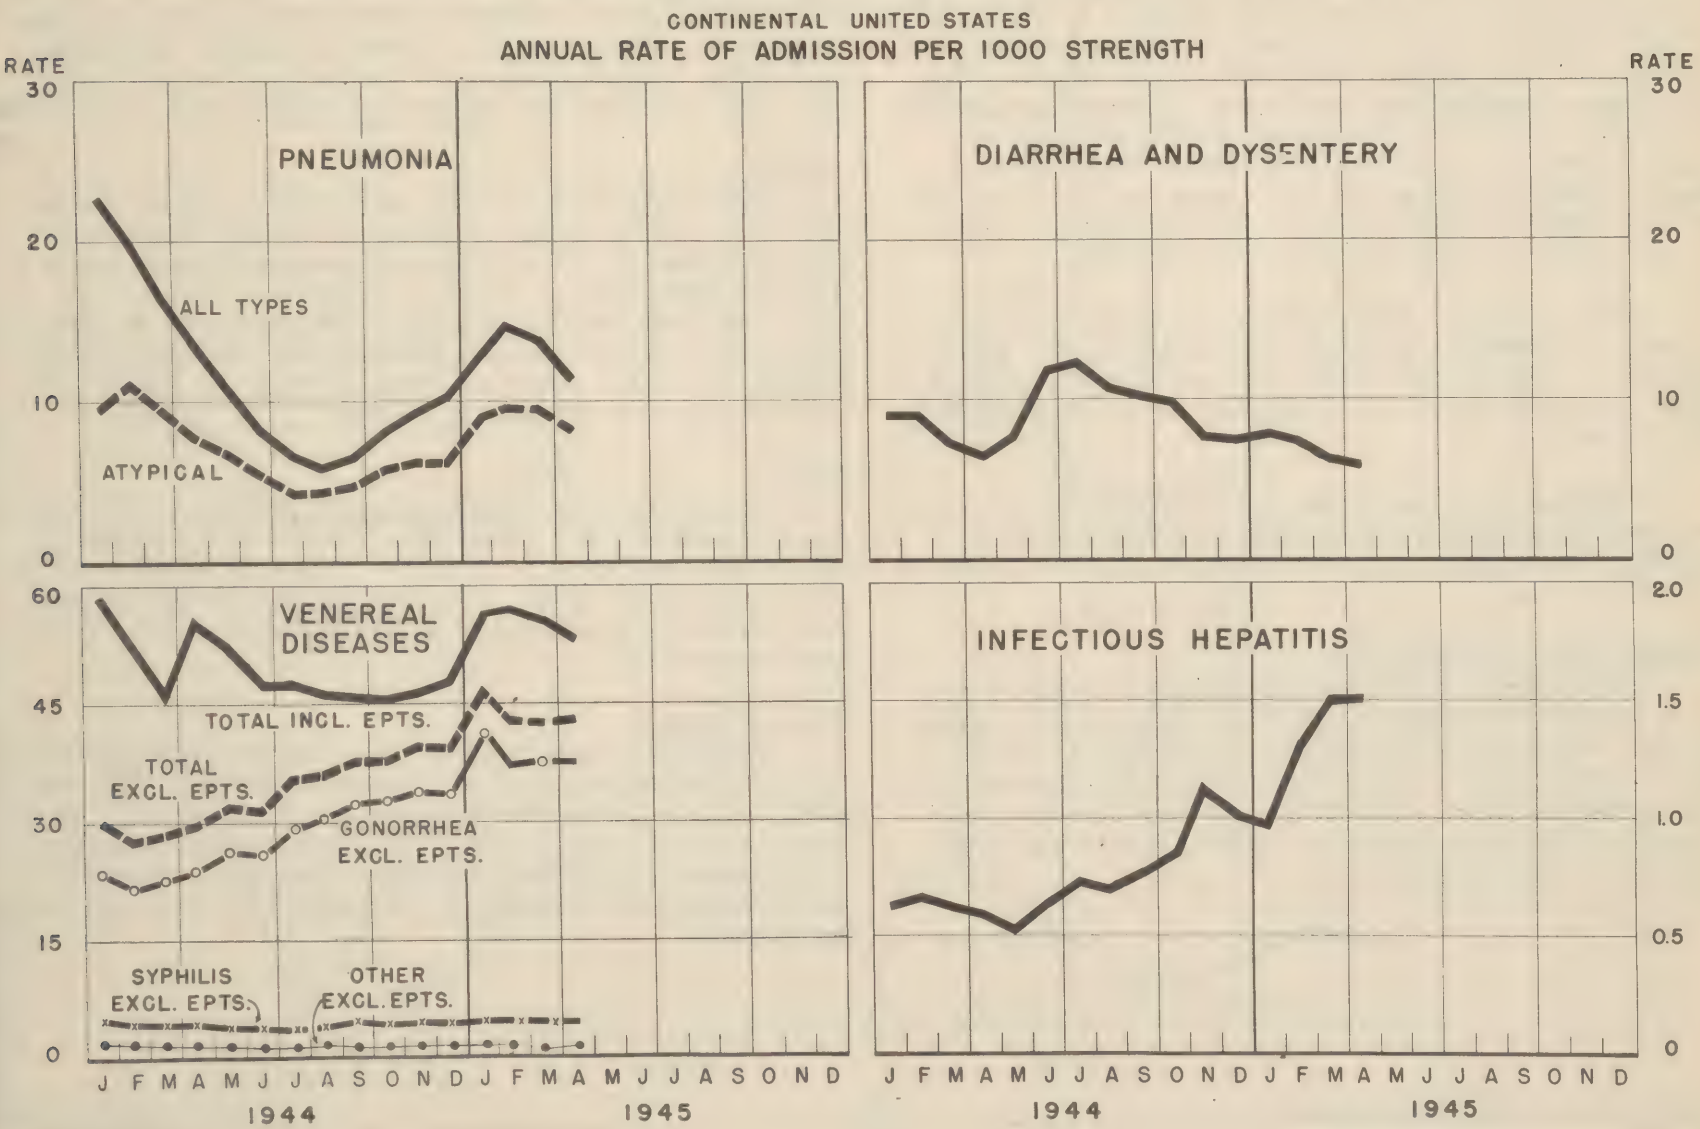

The venereal disease cases remaining under treatment on 27 April are shown below:

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of All Cases	
	Syphilis	Other	Syphilis	Other
TOTAL US.	1476	760	.56	.29
I	82	8	.6	.1
II	47	42	.2	.2
III	171	95	.8	.4
MDW	6	32	.2	.9
IV	364	171	.7	.3
V	52	52	.2	.2
VI	15	30	.1	.2
VII	89	36	.3	.1
VIII	417	203	1.0	.5
IX	233	91	.6	.3

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of April was 8 percent higher than for March, while the number of cases of other venereal diseases decreased about 10 percent. Total venereal cases represented .85 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 10 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 65 percent of the cases remaining under treatment were syphilis cases.

# MORBIDITY FROM—PNEUMONIA—DIARRHEA AND DYSENTERY

## VENEREAL DISEASES—INFECTIOUS HEPATITIS

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Morbidity represented by venereal EPTS cases was reported at 11.7 per thousand during April as compared with 12.9 per thousand for March. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees. The average weekly number of venereal EPTS cases in April was 631 as compared with 697 in March, reflecting the trend of the number of men inducted into the Army.

The total days lost from duty during April because of venereal disease were about 60,000 or an average of 15,000 per week; this represented a non-effective rate of .76 per thousand as compared with .80 in March.

Detailed data as to the April incidence of venereal diseases by color will be presented in a Special Health Report to be contained in Weekly Health Report No. 21.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis remained at about the same level as during the previous three months (about .6 per thousand). The current experience is only about one-half as high as that during the corresponding period of 1944. The Fifth Service Command continued to be the only one to report relatively high morbidity from this cause.

INFECTIOUS HEPATITIS:

Morbidity from infectious hepatitis remained at 1.5 per thousand which is the highest rate reported since the epidemic in the summer of 1942. The Fifth and Sixth Service Commands with rates of about 2.4 per thousand reported the highest morbidity from this cause.

MEASLES:

Morbidity from measles decreased by about 25 percent in April and was reported at 2.4 per thousand. This represents the anticipated seasonal trend since a peak in morbidity is usually attained in March. In 1944 the peak rate was about 3 times as high as that in 1945. The Seventh Service Command was the only one to report admission rates in April notably in excess of the average for the entire country.

MUMPS:

Morbidity from mumps decreased by about 10 percent in April to 9.1 per thousand. This rate is somewhat below the peak rate of 10.6 per thousand registered in March and April 1944. Only the Fifth Service Command had morbidity appreciably in excess of that for the entire country.

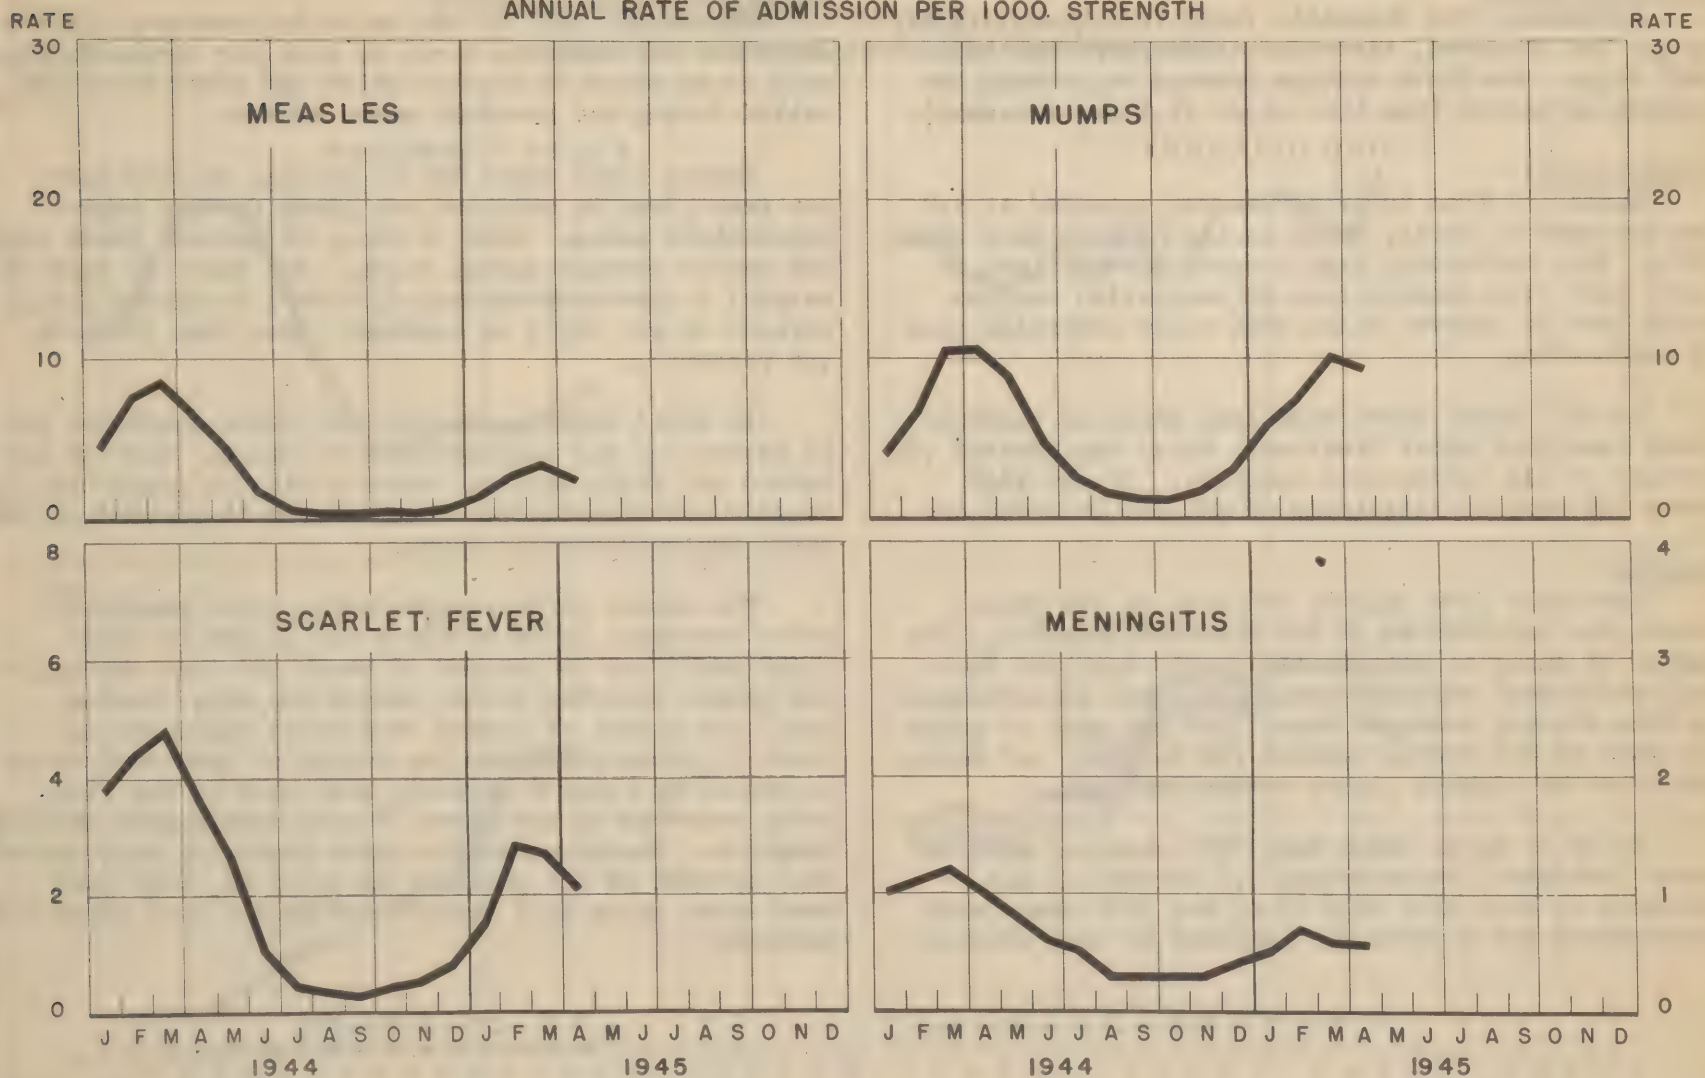

SCARLET FEVER:

Morbidity from scarlet fever decreased slightly in April being reported at 2.1 per thousand. The admission rate for April 1945 was about 40 percent lower than for April 1944. Only the Sixth and Seventh Service Commands reported morbidity from this cause in April notably in excess of the average for the country as a whole.

## SCARLET FEVER ——— MENINGITIS

CONTINENTAL UNITED STATES  
ANNUAL RATE OF ADMISSION PER 1000. STRENGTH

RESTRICTED

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever increased slightly to 1.1 per thousand, the highest rate reported since July 1944. The Sixth Service Command registered the highest morbidity from this cause (1.9 per thousand).

TUBERCULOSIS:

Morbidity from tuberculosis was reported at 1.2 per thousand in April, which is the highest rate since 1943. This relatively high present level arises in large part from examinations at separation centers which tend to uncover cases that would otherwise pass by undetected.

As of 27 April there were 1848 cases of tuberculosis remaining under treatment; these represented .70 percent of all patients in hospital. Of the 1848 cases 968 were at Fitzsimons GH and 515 at Bruns GH.

MALARIA:

Morbidity from malaria acquired in the United States was reported at .2 per thousand in April. The number of cases of malaria presumably acquired overseas which were admitted (or readmitted) for treatment in this country averaged about 1350 per week or about the same as the weekly average for February and March, and thus the highest figure so far recorded.

As of 27 April there were 3501 cases of malaria under treatment, representing 1.3 percent of all patients in hospital; only 13 of the 3501 cases were those where the disease was acquired in this country.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders decreased in April to 44.9 per thousand. This rate is at about 10 percent below the level which prevailed during the previous seven months.

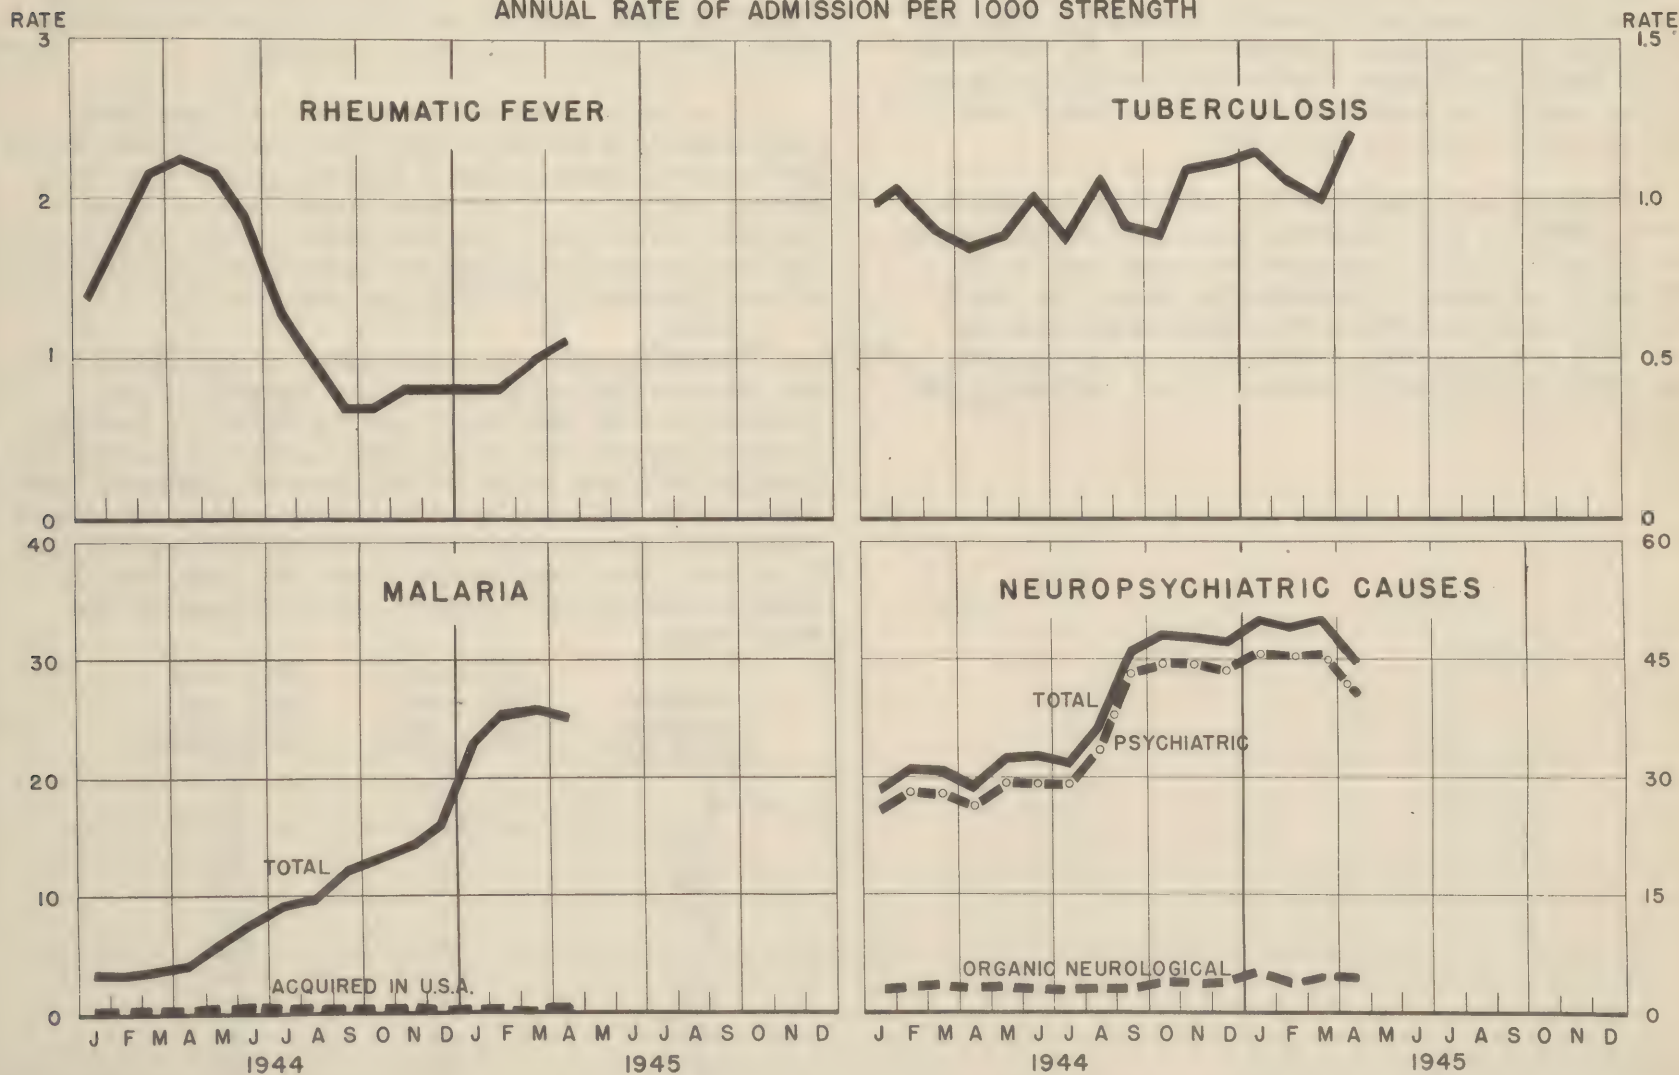

During April there was an average of 1920 CDD's per week given to enlisted men classified as neuropsychiatric cases. This is about 10 percent lower than the weekly average during March. The CDD's in April in respect to neuropsychiatric disorders accounted for 41 percent of all CDD's or somewhat lower than in March (45 percent).

In April organic neurological cases accounted for 10 percent of all neuropsychiatric cases. Only in the Second and Fifth Service Commands did the proportion of organic neuropsychiatric cases exceed 15 percent of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 27 April was 35,696 or about 1,400 more than at the end of March and thus the highest number reported so far during the war. During April the number of locked ward cases decreased by about 5 percent, whereas the number of open ward cases increased by about 6 percent, with most of the rise being reported in the First, Fourth, and Eighth Service Commands. Neuropsychiatric cases remaining represented 13.6 percent of all patients in hospital, with open ward cases being 11.7 percent and locked ward cases 1.9 percent.

# MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES  
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY:

Mortality from all causes during April was reported at 2.34 per year per thousand strength. The mortality rate from disease decreased from .80 per thousand in March to .74 per thousand in April, while the reported mortality rate from injury increased from 1.43 per thousand to 1.52 per thousand.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 1.75 per thousand, resulting in an estimated total death rate from all causes of 2.5 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for Army personnel stationed in this country was about 32 per thousand in April or slightly lower than in March.

The mean number of non-effectives (including evacuees from overseas) for April was reported at 92 per thousand strength or 8 percent higher than in March; most of this increase arose because of an increase in hospital population at General Hospitals. The mean number of injury non-effectives per thousand strength in April was 16.2 per thousand.

Variations in the mean number of non-effectives per thousand strength by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General and Convalescent Hospitals in each Service Command. When comparisons are made between the rates excluding such hospitals, the variations by Service Command are seen to be very much smaller than when the days lost in these hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. and Conv. Hosp.</u>	<u>Excluding Gen. and Conv. Hosp.</u>
